

Caring for Patients with Genitourinary Malignancies

Katie Morgan PharmD and
Tracy Rose MD MPH

Division of Oncology
University of North Carolina at Chapel Hill

1

Objectives

- Understand the breadth of genitourinary malignancies
- Recognize the role of each multidisciplinary team member
- Learn the basics of each major type of GU cancer: prostate, bladder, kidney, and testis
- Review types of cancer treatments used in GU malignancies

2

3

Leading Causes of Death in the U.S.

- Heart disease: 635,206
- **Cancer: 598,038**
- Accidents (unintentional injuries): 161,374
- Chronic lower respiratory diseases: 154,596
- Stroke (cerebrovascular diseases): 142,142
- Alzheimer's disease: 116,103
- Diabetes: 80,058
- Influenza and Pneumonia: 51,537
- Nephritis, nephrotic syndrome and nephrosis: 50,046
- Intentional self-harm (suicide): 44,965

4

Cancer Statistics

Estimated New Cases

			Males	Females			
Prostate	161,360	19%			Breast	252,710	30%
Lung & bronchus	116,990	14%			Lung & bronchus	105,510	12%
Colon & rectum	71,420	9%			Colon & rectum	64,010	8%
Urinary bladder	60,490	7%			Uterine corpus	61,380	7%
Melanoma of the skin	52,170	6%			Thyroid	42,470	5%
Kidney & renal pelvis	40,610	5%			Melanoma of the skin	34,940	4%
Non-Hodgkin lymphoma	40,080	5%			Non-Hodgkin lymphoma	32,160	4%
Leukemia	36,290	4%			Leukemia	25,840	3%
Oral cavity & pharynx	35,720	4%			Pancreas	25,700	3%
Liver & intrahepatic bile duct	29,200	3%			Kidney & renal pelvis	23,360	3%
All Sites	836,150	100%	All Sites	852,630	100%		

FIGURE 1. Ten Leading Cancer Types for the Estimated New Cancer Cases and Deaths by Sex, United States, 2017. Estimates are rounded to the nearest 10 and cases exclude basal cell and squamous cell skin cancers and in situ carcinoma except urinary bladder.

Siegel, 2017

5

Cancer Statistics

Estimated Deaths

			Males	Females			
Lung & bronchus	84,590	27%			Lung & bronchus	71,280	25%
Colon & rectum	27,150	9%			Breast	40,610	14%
Prostate	26,730	8%			Colon & rectum	23,110	8%
Pancreas	22,300	7%			Pancreas	20,790	7%
Liver & intrahepatic bile duct	19,610	6%			Ovary	14,080	5%
Leukemia	14,300	4%			Uterine corpus	10,920	4%
Esophagus	12,720	4%			Leukemia	10,200	4%
Urinary bladder	12,240	4%			Liver & intrahepatic bile duct	9,310	3%
Non-Hodgkin lymphoma	11,450	4%			Non-Hodgkin lymphoma	8,690	3%
Brain & other nervous system	9,620	3%			Brain & other nervous system	7,080	3%
All Sites	318,420	100%	All Sites	282,500	100%		

FIGURE 1. Ten Leading Cancer Types for the Estimated New Cancer Cases and Deaths by Sex, United States, 2017. Estimates are rounded to the nearest 10 and cases exclude basal cell and squamous cell skin cancers and in situ carcinoma except urinary bladder.

Siegel, 2017

6

Most Common GU Cancers

- Prostate
- Bladder
- Kidney
- Testis (germ cell tumors)

7

Radiation Oncologists

8

Prostate Cancer

Prostate cancer is a disease in which malignant (cancer) cells form in the prostate gland

<https://www.cancer.org/cancer/prostate-cancer/about/what-is-prostate-cancer.html>

9

Physiology of Prostate Cancer

- Partly glandular and muscular organ within lower pelvis
- Accessory reproductive gland
- Secretes alkaline fluid that forms a part of the ejaculate which aids in motility and nourishment of sperm
- 4 zones: peripheral (75%), central, transition, fibromuscular
- Size of a walnut in young men, but grows with age

10

Pathophysiology of Prostate Cancer

- ~90% are adenocarcinomas (formed from the gland cells)
 - Remaining ~10% are primarily neuroendocrine
- Typically spreads first to lymph nodes
- Metastasis = distant spread outside the prostate
 - Bone most common
 - Distant lymph nodes
 - Organs less common – and a bad sign!
- Commonly diagnosed by digital rectal exam or PSA

11

Clinical Presentation

- **Usually asymptomatic**
- Lower urinary tract symptoms (LUTS)
- Bony pain
- Renal failure
- Spinal cord compression

12

Diagnosis

- Shared decision making to screen
- PSA, DRE
- Prostate biopsy
 - Office procedure
 - transrectal ultrasound guided
 - 12 cores
 - Minor prep

13

Grade = measure of the microscopic appearance (ie, how much does it resemble normal prostate?)

14

Cancer Staging

- Define as precisely as possible the **extent** of disease

- **Rationale:** Staging will determine
 - Treatment
 - Prognosis
 - Surveillance

- A common currency for reporting treatment results

15

Prostate Cancer Staging

Group	T	N	M	PSA	Gleason
I	T1a-c	N0	M0	PSA <10	Gleason ≤6
	T2a	N0	M0	PSA <10	Gleason ≤ 6
	T1-2a	N0	M0	PSA X	Gleason X
IIA	T1a-c	N0	M0	PSA <20	Gleason 7
	T1a-c	N0	M0	PSA ≥10<20	Gleason ≤ 6
	T2a	N0	M0	PSA ≥10<20	Gleason ≤ 6
	T2a	N0	M0	PSA <20	Gleason 7
	T2b	N0	M0	PSA <20	Gleason < 7
	T2b	N0	M0	PSA X	Gleason X
IIB	T2c	N0	M0	Any PSA	Any Gleason
	T1-2	N0	M0	PSA ≥ 20	Any Gleason
	T1-2	N0	M0	Any PSA	Gleason ≥ 8
III	T3a-b	N0	M0	Any PSA	Any Gleason
IV	T4	N0	M0	Any PSA	Any Gleason
	Any T	N1	M0	Any PSA	Any Gleason
	Any T	Any N	M1	Any PSA	Any Gleason

16

Principles of Treatment

Local	vs	Locoregional	vs	Systemic
Surgery		Surgery		Chemotherapy
Radiation		Radiation		

Commonly we combine these approaches
= Multimodality treatment

17

Prostate Cancer Treatment

Active Surveillance

- Typical criteria: PSA <10, Gleason 6, Stage T1c-T2a, >10 yr life expectancy, low volume
- Follow up: PSA & DRE every 3-6 months, biopsy annually
- Intervention: Change on biopsy, concerning PSA trend
- Not appropriate for all men meeting criteria
- Other: Age, comorbidities, anxiety, commitment to follow up schedule

18

Prostate Cancer Treatment

Radical prostatectomy

- Surgical removal of the prostate gland and seminal vesicles
- Open, laparoscopic, robotic techniques
- Considerations: Age, comorbidities, prior abdominal surgeries
- 1 night in the hospital, leave with catheter
- Side effects: Erectile dysfunction, urine leakage, infertility
- Follow up: every 3 months x 1 year; every 6 months until year 5, annually until year 10

19

Prostate Cancer Treatment

Radiation Therapy

- Intensity Modulated Radiation Therapy: gives higher dose to prostate and less to surrounding tissue
- Uses a machine outside the body to deliver radiation
- Usually 5 days/week, 4-6 weeks
- If >intermediate risk disease will get hormone shots too
- Side effects: urinary symptoms, diarrhea, rectal irritation, fatigue, erectile dysfunction

20

Prostate Cancer Treatment

Brachytherapy

- Radioactive seeds implanted into the prostate
- Low risk disease; prostate size matters
- Side effects: Urinary retention, painful urination, erectile dysfunction

21

Prostate Cancer Treatment

Cryotherapy

- Surgical freezing of the prostate
- Causes cell death
- Candidates: Unfit for surgery or radiation
- Side effects: Erectile dysfunction (near 100%), rectal pain, urinary symptoms

High-intensity focused ultrasound (HIFU)

- Ablates tissue using heat
- Side effects: urinary symptoms, erectile dysfunction

22

Advanced Prostate Cancer Treatment

- Metastatic or stage IV prostate cancer is not curable
- Treatment focus is on prolonging as good a life as possible = PALLIATIVE
- Cornerstone of treatment is blocking the tumor's access to the male hormone testosterone – more to come!
- Also use standard chemotherapy

23

Bladder Cancer

- Typically diagnosed in 5th-7th decade
- Global disease: ~350,000 new cases/year
 - The most common GU cancer in China
- Non-muscle-invasive: 75% at presentation
- **Highest recurrence rate** of any cancer
 - Substantial burden of health services
- Comparatively poor research funding

<https://www.cancer.org/cancer/bladder-cancer/about/what-is-bladder-cancer.html>

24

Bladder Cancer – Risk Factors

- Male sex
- Cigarettes: 3x risk in current smokers
 - (50% reduction after quitting 5y)
 - Not just lung cancer
 - SMOKING CESSATION
- Family history and/or genetic mutations
- Age
- Chemical exposures
 - Aniline dye, gas/soot from coal, analgesic (phenacetin), dyes, rubber
 - Cyclophosphamide: Acrolein (urinary metabolite of Cytoxan) can cause hemorrhagic cystitis. Latency period 6-13 years
 - Occupations: Textile workers, truckers, leather/dye workers, painters, hairdressers, dry cleaners
- Pelvic Radiation
- Chronic cystitis
 - Long term indwelling catheters, chronic UTI, stones, schistosoma haematobium

25

Bladder Cancer – Staging

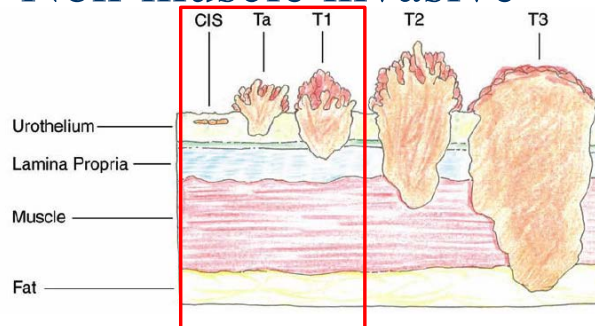

- Presence, Depth of Invasion
- ~25% muscle-invasive at presentation
- “Superficial” → non-muscle invasive
 - T1: still invasive

26

Bladder Cancer Treatment – Non-muscle invasive

- Resect it via cystoscopy (via a camera in the bladder – “transurethral”)
- Sometimes put BCG (yes, like the TB vaccine) or other therapy directly into the bladder
- Emerging data on intravenous treatments to retrain the immune system

27

Bladder Cancer Treatment – Muscle-invasive

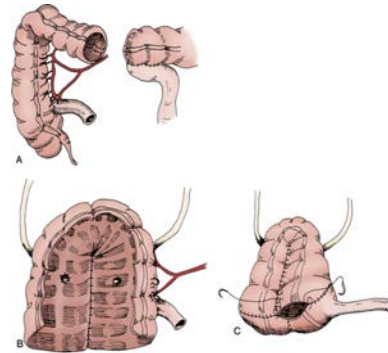

- A true multidisciplinary team approach
- Typically treat with chemotherapy followed by bladder removal (“cystectomy) or transurethral resection followed by chemotherapy plus radiation therapy

28

Bladder Cancer Treatment – Cystectomy with Urinary Diversion

Ileal conduit

Continent cutaneous diversion

29

Bladder Cancer Treatment – Ostomy Care

- Urinary diversion management
 - Skin irritation
 - Properly fitting appliance/leaking
 - Odor
 - Body image
 - Intimacy
 - Supplies
 - Consult WOCN

30

Bladder Cancer Treatment – Advanced Disease

- Unresectable and metastatic bladder cancer remains incurable
- Chemotherapy historically was the cornerstone of treatment
- Finally some progress
 - 5 new immunotherapies, 1 targeted therapy, and 1 new “antibody-drug conjugate) approved in the last several years!
- Supportive care is crucial

31

Kidney Cancer

<https://www.cancer.org/cancer/kidney-cancer/about/what-is-kidney-cancer.html>

32

Kidney Cancer = not a single disease

W. Marston Linehan et al. Clin Cancer Res 2004;10:6282S-6289S
 ©2004 by American Association for Cancer Research

33

Kidney Cancer – Presumed cell of origin

Morais et al, Int J Biochem & Cell Biol 43(2011):1537-1549.

34

Kidney Cancer - Types

- The most common type is clear cell renal cell carcinoma (RCC)
- Clear cell RCC is almost universally characterized by loss of the von Hippel Lindau (VHL) gene
- A familial (autosomal dominant) cancer syndrome of germline VHL mutation can predispose to kidney cancer, although most cases of clear cell RCC as sporadic

W. Marston Linehan et al. Clin Cancer Res 2004;10:6282S-6289S

35

Kidney Cancer – Risk Factors

Risk Factor	Comment
Smoking	
Hypertension	Dose-response relationship
Obesity	Dose-response relationship
Acquired cystic kidney disease	Usually dialysis-associated
Occupational Exposures	Asbestos, Cadmium, Gasoline
Others: Familial cancer syndromes, analgesics, hepatitis C, cytotoxic chemotherapy, sickle cell trait (risk for renal medullary carcinoma)	

36

Kidney Cancer – Symptoms

- “Classic triad” of symptoms for RCC:
 - Flank pain
 - Hematuria (blood in the urine)
 - Palpable abdominal mass.
- Other symptoms:
 - Scrotal varicocele
 - Lower extremity edema
 - Ascites
- Tumors can get BIG before they are detected
- Common sites of metastases: lung, lymph nodes, bone, brain

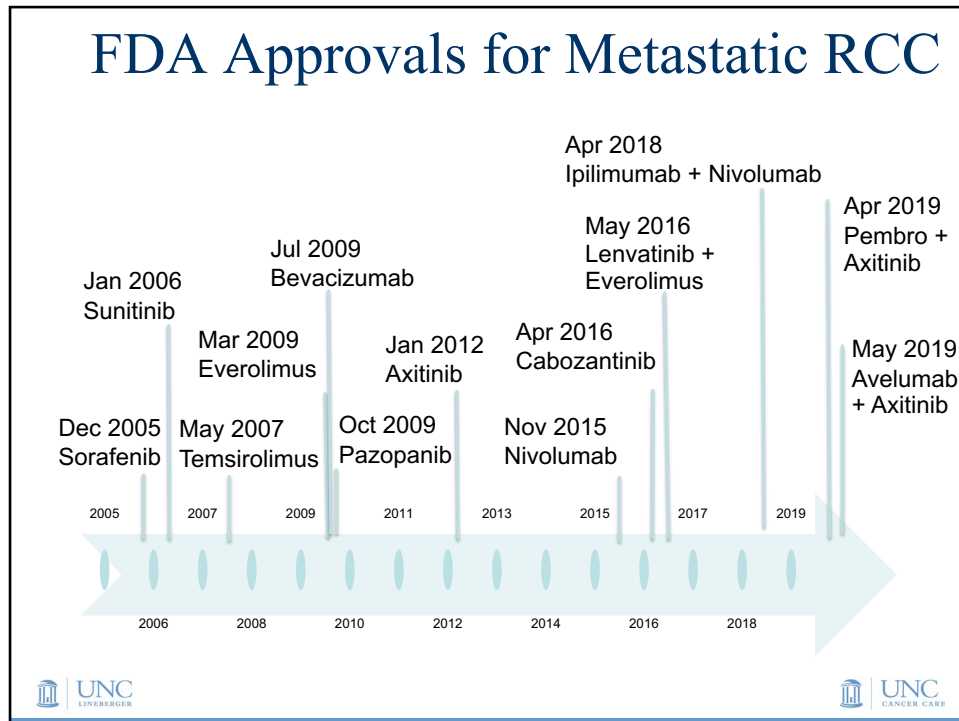

37

Kidney Cancer – Treatment

- Localized = Surgery
 - ie, if you can cut it out, do it
- Metastatic
 - Chemotherapy doesn't work
 - Immunotherapy or targeted therapy

38

39

Testis Cancer in 1 Slide

- Most cases are “germ cell tumors” – meaning they start from the cells that make sperm
- 10,000 new cases per year
- Typically age 20s-40's
- **VERY CURABLE**
- Orchiectomy (removal of the testicle) cures many
- If has spread to lymph nodes, can get surgery, radiation or chemotherapy depending on type and extent of the cancer
- Advanced disease treated with chemotherapy, which is very effective

40

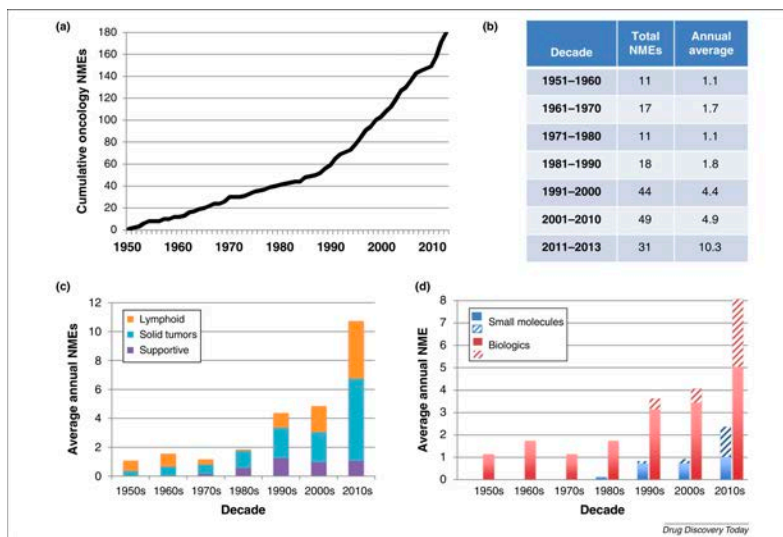

Supportive Care

- Bone health
 - Drugs (such as those used for osteoporosis)
 - Calcium and Vitamin D
 - Weight Bearing exercise
- Pain control
- Depression/anxiety
- Treatment side effects
 - Nausea control, blood product support, etc
- Grief counseling

41

Oncology drug approvals are skyrocketing.

An analysis of FDA-approved drugs for oncology, Drug Discovery Today 2014 19(12):1831.

43

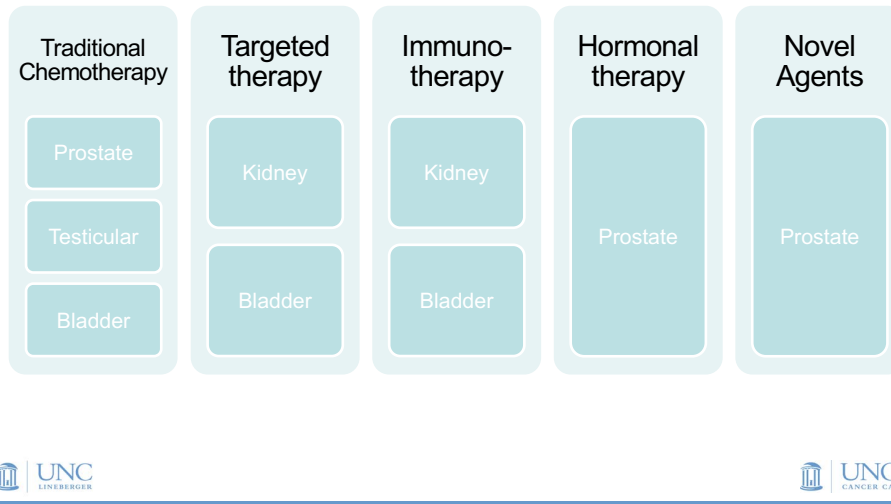

Drug therapy in Genitourinary (GU) cancers

Katie Morgan, PharmD, BCOP, CPP
GU/Neuro Oncology Clinics
University of North Carolina Medical
Center

44

Classes of Drugs used in GU cancers

45

Traditional Chemotherapy

- Classes of chemotherapy agents
 - Alkylating Agents
 - Antimetabolites
 - Antimicrotubule Agents
 - Topoisomerase inhibitors
 - Other “typical” chemotherapeutics

46

The cell cycle

https://commons.wikimedia.org/wiki/File:Cell_cycle_simple.png

47

Cell cycle non-specific agents

- Effects exerted at any phase of the cell cycle
- Toxic effects occur during cell cycle and are expressed during attempt at cell division
- May be more effective given as a bolus dose
 - Examples:
 - Alkylating agents
 - Anthracyclines
 - Platinum agents

48

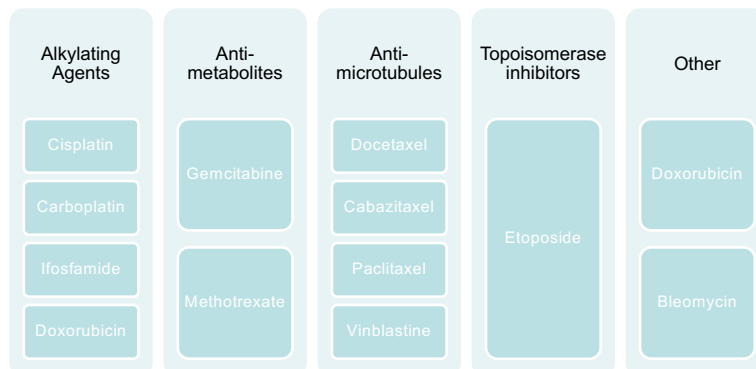

Cell Cycle specific agents

- Cell Cycle Specific
 - Effect exerted on dividing cells only
 - Not active in resting phase
 - Administration as continuous infusion or multiple divided doses
 - Examples:
 - Antimetabolites
 - Vincas
 - Taxanes
 - Topoisomerase Inhibitors

49

Specific agents used in GU cancers

50

Supportive Care for traditional Chemotherapy

- Chemotherapy induced nausea and vomiting (CINV)
- Myelosuppression
- Mucositis
- Organ toxicity
 - Renal
 - Liver
 - Cardiotoxicity
 - Lung toxicity

51

Targeted Therapy

- Refers to newer generation of agents targeted at cellular processes
 - Monoclonal antibodies
 - Antibody drug conjugates
 - Tyrosine kinase inhibitors
 - Small molecule inhibitors

52

Monoclonal Antibodies

Murine
100% mouse protein
muromonab

Chimeric
33% mouse protein
cetuximab, rituximab

Humanized
10% mouse protein
bevacizumab, trastuzumab

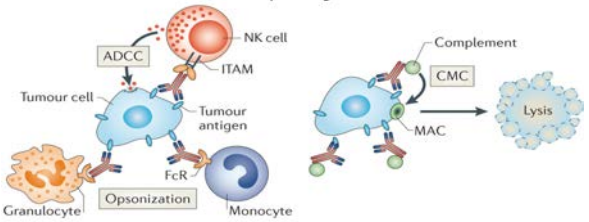

Human
0% mouse protein
panitumumab

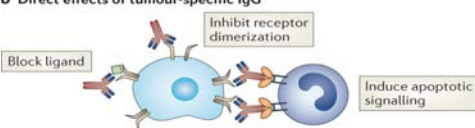

53

Monoclonal Antibody Mechanism of Action

a Immune-mediated effects of tumour-specific IgG

b Direct effects of tumour-specific IgG

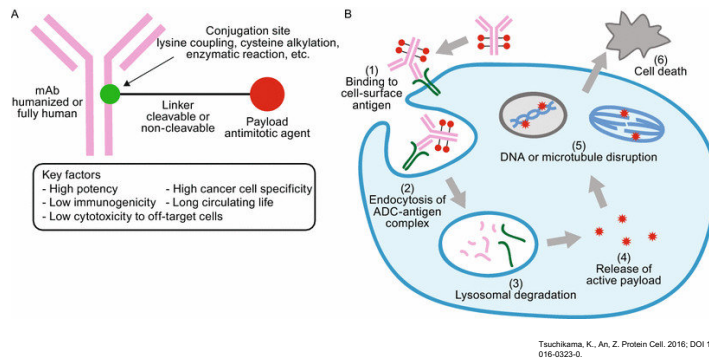

Nature Reviews | Cancer

54

Antibody Drug Conjugates Mechanism of Action

55

Tyrosine Kinase Inhibitors (TKIs) and Small Molecules

<https://www.cancerresearchuk.org/about-cancer/cancer-in-general/treatment/targeted-cancer-drugs/types/cancer-growth-blockers>

56

Targeted Therapy and Downstream Effects

Dr. GK, Adjei, A. CA Cancer J Clin 2013;63:249-278.

57

Molecular Targets in GU

Kidney

Vascular endothelial growth factor (VEGF)

Mammalian target of rapamycin (mTOR)

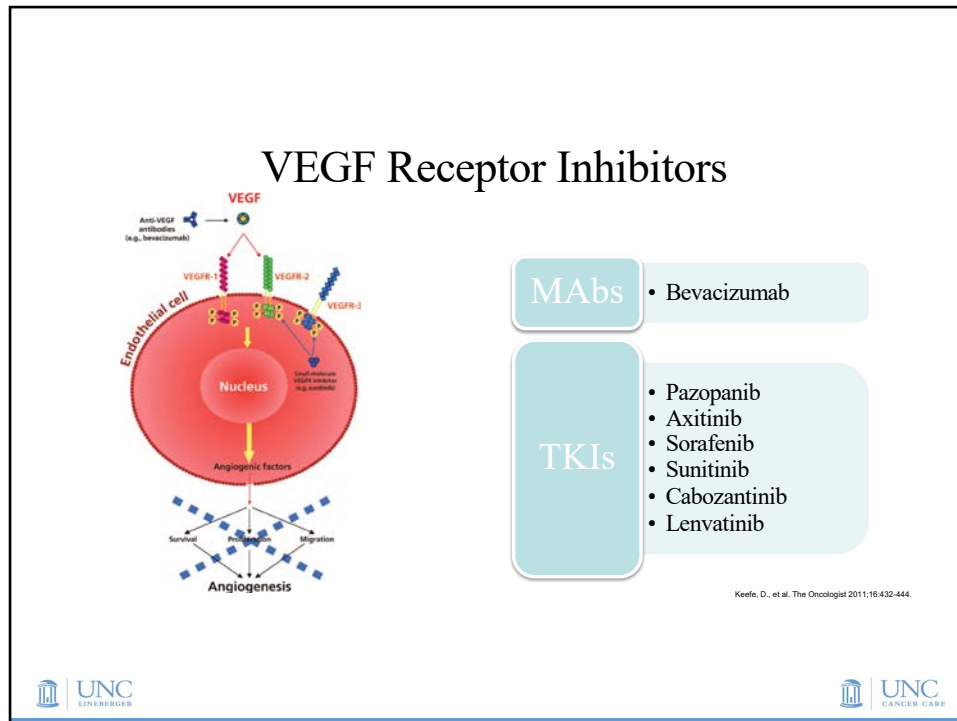

Bladder

Fibroblast growth factor receptor (FGFR)

Nectin-4

58

59

VEGF Receptor Inhibitors Side Effects

- Target Side Effects
 - Hypertension, heart failure, impaired wound healing, proteinuria, bleeding complications, thrombosis, GI perforation
- Monoclonal Antibodies- infusion reactions
 - Bevacizumab
- Tyrosine Kinase Inhibitors- diarrhea, hand foot syndrome
 - Pazopanib: changes in liver function
 - Sorafenib/Sunitinib: decreased blood counts
 - Axitinib: stomatitis, thyroid disorders
 - Cabozantinib: changes in liver function, thyroid disorders
 - Lenvatinib: thyroid disorders

Keefe, D., et al. The Oncologist 2011;16:432-444.

60

mTOR inhibitors- Everolimus/Temsirolimus

- mTOR inhibitors decrease intracellular signaling downstream of PI3-K/Akt pathway resulting in decreased protein synthesis and apoptosis
- Everolimus- oral mTOR inhibitor
 - Used typically second or third line, monotherapy or in combo with VEGF-Inhibitor
 - Toxicities – mucositis, diarrhea, hyperlipidemia, hyperglycemia, pneumonitis
 - Dexamethasone mouth rinse recommended as prophylaxis
- Temsirolimus – IV mTOR inhibitor
 - Favored in poor risk disease (historically)
 - Toxicities- rash, anemia, nausea, peripheral edema, hyperlipidemia, hyperglycemia

Battelli, C., Cho, D.C., Therapy 2011;8(4):359-367.

61

FGFR inhibitor- Erdafitinib

- Targets gene mutations in FGFR
 - inhibits downstream signaling and tumor growth
- Incidence of FGFR mutations/alterations is about 20% in bladder cancer
- 40% response rates vs. 9% with alternative therapy
- Toxicity
 - Hyperphosphatemia, fatigue, diarrhea, nail toxicity, ocular toxicity, dry mouth, dry eyes, decreased appetite
 - Lubricating eye drops recommended when starting treatment

Casadei C, et al. Ther Adv Med Oncol. 2019; 11: 1758835919890205.
Lorrey, V., et al. N Engl J Med 2019;381:338-48.

62

NECTIN-4 inhibitor- Enfortumab-vedotin

- Nectin involved in polarity, proliferation, differentiation and migration in epithelial, endothelial, immune and nervous systems.
- High expression on bladder cancer cells but low expression in normal tissue
- 40% response rates
- Toxicity
 - Rash, peripheral neuropathy, hyperglycemia, fatigue, diarrhea, nausea, decreased appetite

<https://www.creativebiolabs.net/enfortumab-vedotin-antibody.html>
Kozlberg et al. J Clin Oncol 2019;10.1200/JCO.1901140.

63

Immunotherapy

<https://www.aacbio.com/applications/cancer-immunotherapy/>

64

Immunotherapy

65

CTLA-4 Inhibitor: Ipilimumab

66

PD-1/PD-L1 Inhibitors

PD-1 Inhibitor

- Pembrolizumab
- Nivolumab

PD-L1 Inhibitors

- Atezolizumab
- Avelumab
- Durvalumab

http://labotech.eu/fitzer-merck-ovarian-cancer-trial-avelumab-pd-1-immunotherapy/

67

Immune Related

Dermatological

- Typically faint erythematous, reticular and maculopapular rash
- Common iAE
- Topical corticosteroids and antipruritics, followed by oral corticosteroids (prednisolone 1mg/kg or equivalent) for more severe cases

Hepatic

- Elevations in aspartate transaminase, alanine transaminase and occasionally bilirubin. Often asymptomatic
- Commonly discovered through frequent liver function test monitoring, which is a requirement of therapy
- **Important:** Rule out other causes before treating (e.g. viral, other drug induced)
- Oral corticosteroids, if ineffective, oral methylprednisolone 500mg twice daily (BD) may be effective. Avoid influenza (vacc) to hepatotoxicity risk

Gastrointestinal

- Diarrhea
- Abdominal pain
- Endoscopic/histological evidence of inflammation
- Common iAE
- **Important:** Rule out other causes (e.g. infective)
- Mild symptoms can be managed with loperamide followed by oral or intravenous (IV) corticosteroids. More severe cases may require infliximab (5mg/kg)

Endocrine

- Often difficult diagnosis
- Non-specific (e.g. fatigue, nausea or headache)
- Thyroid function tests monitored frequently during treatment may diagnose issues before patients are symptomatic
- Hypothyroidism far more common than hyperthyroidism
- Typical management of hypothyroidism/hyperthyroidism
- Hypothyroidism will likely require long-term levothyroxine and/or oral hydrocortisone supplementation

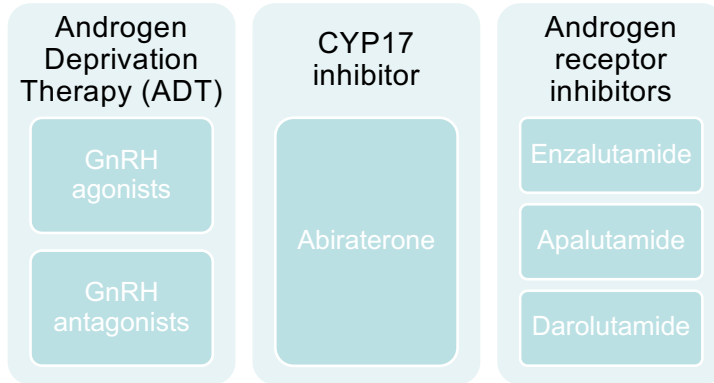

Respiratory

- Pneumonitis
- Relatively rare but potentially life threatening
- Shortness of breath, cough, chest infection
- Bronchoscopy may be required to rule out other infectious causes
- Mild: May require withholding treatment, followed by oral or IV corticosteroids
- Severe: Typically involves high-dose IV corticosteroids and/or infliximab
- More severe cases will likely result in treatment cessation

Evans, B., Evans, S. The Pharmaceutical Journal. 2018. <https://www.pharmaceutical-journal.com/cpd-and-learning/learning-article/immune-checkpoint-inhibitors-in-cancer-pharmacology-and-toxicities/20204831/article/7/ris/Pass=false>

68

Hormonal Therapy for Prostate Cancer

69

GnRH Agonists and Antagonists

Rosario et al. World J Urol 2016;34:1601-09.

70

LHRH Agonists and Antagonists

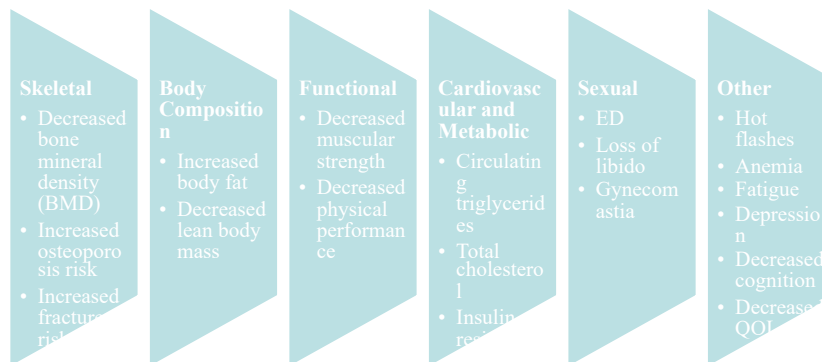

- GnRH Agonists
 - Leuprolide, histrelin, goserelin, triptorelin
 - Injections can be given every 1, 3, or 6 months depending on formulation
 - Tumor flare a concern with initial increase in testosterone
 - Can take up to 30 days to reach castration levels of testosterone
- GnRH Antagonist
 - Degarelix
 - SC injection given every 1 month
 - Reduces testosterone to castration levels within 3 days
 - Preferred for patients with advanced disease where testosterone flare would lead to worsening pain, urinary obstruction or spinal cord compression

Rosario DJ, et al. World J Urol 2016;34:1601-1609.
Crawford ED, et al. Prostate Cancer Prostatic Dis 2019;22(1):24-38.

71

Effects of Androgen Deprivation Therapy

Gardner JR, et al. J Clin Oncol. 2014;32(4):335-346.

72

Abiraterone Acetate

- Anti-androgen therapy
- Inhibits steroid 17-hydroxylase/17,20-lyase
- Decreases adrenal androgen synthesis
 - Testosterone → DHT
- Decreases cortisol synthesis
- Results in increased ACTH production and mineralocorticoid excess

vivo.colostate.edu

73

Abiraterone Acetate

- Approved in mCSPC and mCRPC with data in high risk localized/nodal disease
- Adverse Events
 - **Mineralocorticoid excess syndrome** (hypertension, hypokalemia, edema)
 - PREDNISONE REQUIRED- mimics normal cortisol production and minimizes AEs
 - Dose of 5-10 mg per day
 - Caution in patients with CHF, recent MI, CVD, ventricular arrhythmia
 - Hepatic toxicity requires close monitoring of LFTs for first 3 months
 - Androgen deprivation AEs
- Administration- taken on an empty stomach, fat increases AUC x 10 fold
- Cost- \$12,000/m

Auchus et al. Oncologist 2014;19:1231-40.

74

Androgen Receptor Inhibitors

Enzalutamide, Apalutamide, and Darolutamide

- Mechanism of Action
 - Binds to AR receptor
 - inhibits translocation of AR receptor into nucleus
 - inhibits DNA binding and coactivator recruitment
- Common side effects; fatigue, dizziness, hot flashes, arthralgias
- Blood brain barrier penetration; Seizure risk highest with enzalutamide
Enzalutamide > Apalutamide > Darolutamide

Ammannagari et al. AJHO 2015;11(2):15-19.

75

Novel Agents for Prostate Cancer

Radium 223

Sipuleucel-T

76

Radium-223 (Xofigo)

- Alpha-emitter calcium mimetic
 - Selectively binds to areas of high bone turnover
 - Induces double stranded DNA breaks
- Treatment of mCRPC with **bone only metastasis**
- ADE- hematologic toxicities, N/V
- Cost - 1000 kBq/mL vial is **\$13,800**
 - One dose could be 4 or more vials x 6 treatments

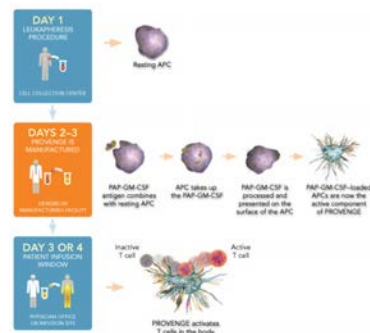

Nilsson et al. Lancet Oncol 2013;369:213-23.

77

Sipuleucel – T (Provenge)

- APCs stimulate T-cell immune response targeted against prostatic acid phosphatase (PAP), which is highly expressed in prostate cancer cells
- Treatment of **asymptomatic or minimally symptomatic** mCRPC
- ADE- infusion related reactions
- Cost- \$93 K (3 doses)

Kantoff et al. NEJM 2010;363:411-22.

78

Sipuleucel – T (Provenge) Process

- Complicated approval and process
 - Application sent to company who then if patient is eligible they do insurance approval
 - Vein assessment by Red cross
 - Peripheral collection vs apheresis catheter
 - Collection via leukapheresis and antigen presenting cells (APCs) isolated ex vivo
 - Sent to Dendreon's manufacturing facility in New Jersey
 - Harvested APCs are incubated with recombinant fusion protein antigen, which contains both PAP and GM-CSF
 - The activated, antigen-loaded APCs are transported back to the infusion center and are infused into the patient
 - From apheresis to administration takes 4 days

Kantoff et al. NEJM 2010;363:411-22.
Anassai et al. PT 2011;36(4):197-202.
